My research on Reflective Practice

Aims and Objectives:

- To explore whether health care professionals found reflective practice with peers following the death of a child in hospital supportive.

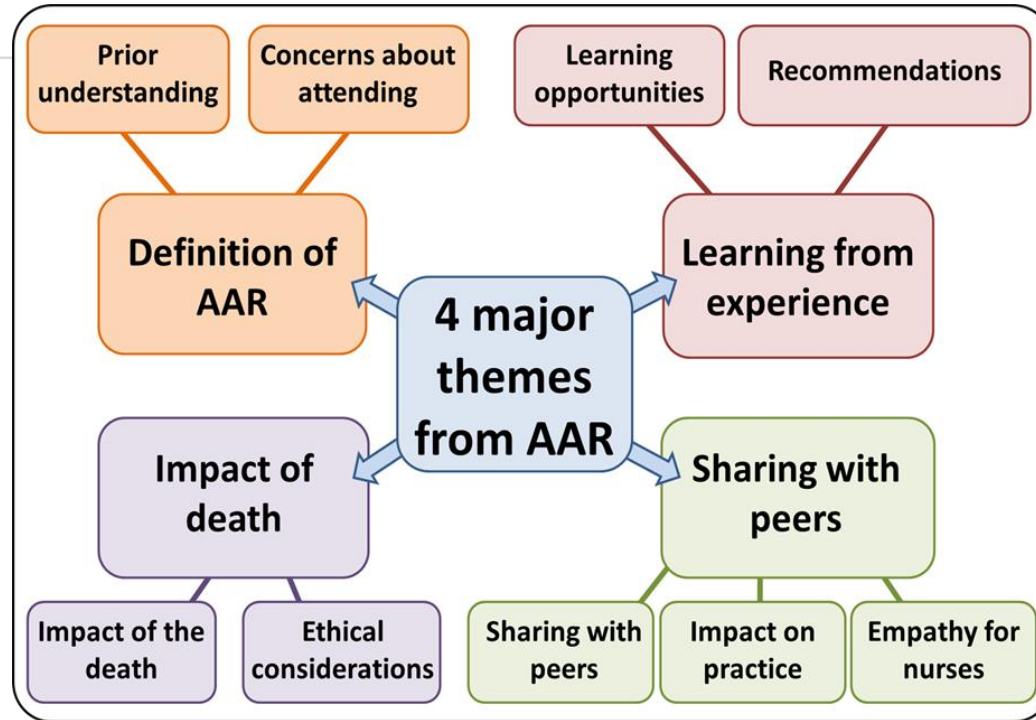

Study Method:

- Semi structured interviews with healthcare professionals who had attended at least 1 AAR within CHI @ TS
- 8 professionals participated in the research

Themes and sub-themes

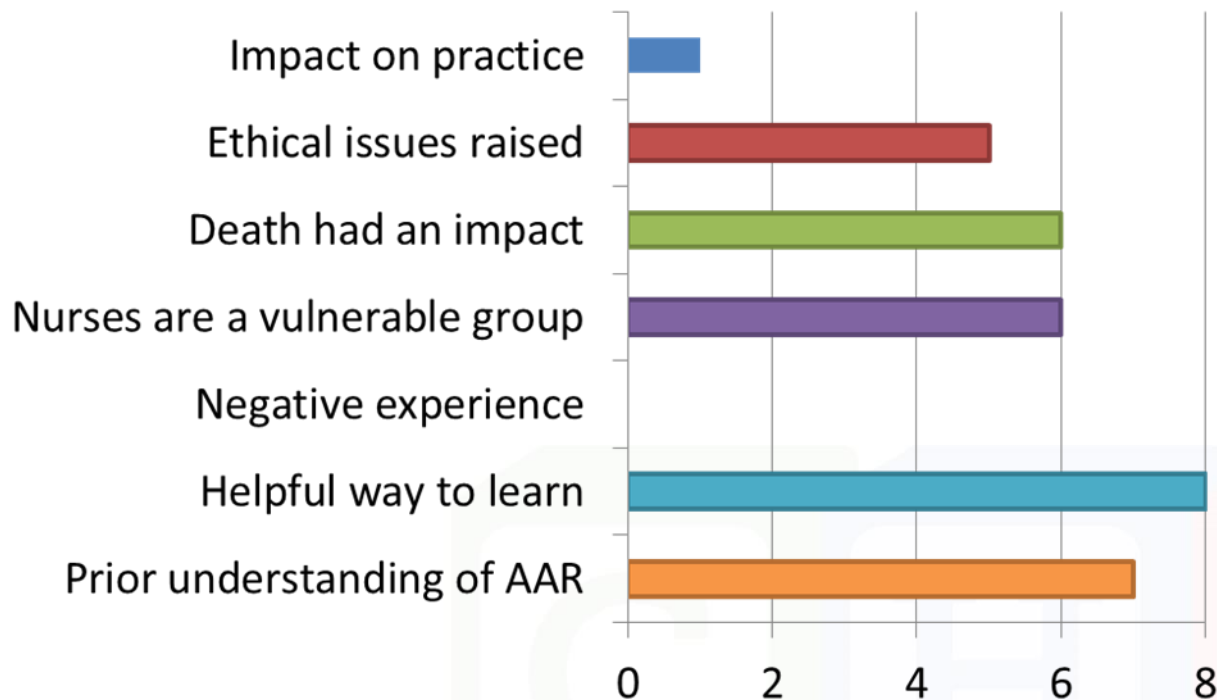

“Yeah, it's always good. Because it's not personal criticism or personal knock or anything... it's collective feedback into the group. In fact, if you look at it collectively, it's for the benefit of improving everything that we all do individually to come together as a service... as one service for families.”

“...but I realised for those 12 hours, they were sitting beside these parents as their children are dying, you know, it's a very... you know, they have a much more intimate relationship at the time.”

My findings...

Findings

Take Home Message

Reflective Practice can help improve communication and peer support amongst the Multi-Disciplinary Team following the death of patient.

After Action Reflections are a considered a suitable reflective tool.

Passion is not an antidote for burnout
